

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

A novel Idea of a Tufted Titmouse.—On April 10, 1897, while wandering leisurely along the border of a wood outside of Beverly, N. J., my eye caught sight of the peculiar actions of a small bird ahead of me. Walking cautiously to within a reasonable distance and using my field glasses, I observed a Tufted Titmouse (*Parus bicolor*), as I supposed trying to drive a red squirrel away. The squirrel was lying flat on the upper side of a large sloping limb, and the Titmouse would approach cautiously from behind and catch at its tail. It was not long before I noticed that the bird had collected quite a mouthful of the hairs, with which it flew off to a hole near by where it was deposited. This is certainly one of the most interesting novelties in relation to nest building that I ever met with. A friend who was with me also observed the occurrence.—J. HARRIS REED, *Beverly, N. J.*

Absence of *Turdus aonalaschkæ pallasii* at Tadousac, Quebec, in 1896.—The almost complete absence of the Hermit Thrush from the vicinity of Tadousac during the summer of 1896 was very noticeable. During six weeks spent there in June and July, the only evidence I found of the presence of the birds was a single family seen one day late in July. In other years this species has been nearly as abundant as the Olive-backed Thrush (*T. u. swainsonii*), and many of each could be heard every day, but last summer the Olive-backs alone were heard, and I wondered where the Hermits had gone. The freeze of a couple of winters ago which was so destructive to the Bluebirds in the Southern States, doubtless is responsible, in part at least, for the sudden diminution in the number of Hermits, and I have already seen some allusion made to this species as one of the sufferers.—JONATHAN DWIGHT, JR., M. D., *New York City.*

A Great Flight of Robins in Florida.—Mr. James K. Knowlton of Swampscott, Mass., informs me that he saw an enormous flight of Robins (*Merula migratoria*) on February 14, 15, 16, 1897, at Hawks's Park, situated on a branch of Indian River, about one hundred miles south of St. Augustine, Florida. They came from a southerly direction, and were continually passing, alighting and repassing, on the above dates, the general movement being in a northerly direction. The air was full of them, and their numbers beyond estimate, reminding him of bees. Mr. Knowlton heard that this movement of Robins had been noted for a distance of *ten* miles away, *across* the flight. Mr. K. shot about one hundred as they flew past the house where he was staying; he could have killed a thousand, he says (so there is *something* to be grateful for!) and reiterates that, "he saw more Robins than he had heretofore supposed existed in the world." Though a sportsman all his life, and frequenting localities where large numbers of birds congregate, like Currituck Sound, he states, without hesitation, that this was the largest flight of birds he had ever seen in his life.—GEORGE H. MACKAY, *Nantucket, Mas.*
